

Intel® 41110 Serial to Parallel PCI Bridge

Datasheet

Product Features

- x8 PCI Express to Single PCIX/PCI bus bridge
- *PCI Express Specification*, Revision 1.0a
- Support for single x8, single x4 or single x1 PCI Express operation.
- Supports 64-bit PCI-X 133 MHz, 100 MHz and 66 MHz as well as PCI 66 MHz and 33 MHz for mixed PCI/PCI-X modes and frequency bus/device operation
- 64-bit addressing support
- 32-bit CRC (cyclic redundancy checking) covering all transmitted data packets.
- 16-bit CRC on all link message information.
- Raw bit-rate on the data pins of 2.5 Gbit/s, resulting in a raw bandwidth per pin of 250 MB/s.
- Maximum realized bandwidth on PCI Express interface is 2 GB/s (in x8 mode) in each direction simultaneously, for an aggregate of 4 GB/s.
- *PCI Local Bus Specification*, Revision 2.3.
- *PCI-to-PCI Bridge Specification*, Revision 1.1.
- *PCI-X Addendum to the PCI Local Bus Specification*, Revision 1.0b
- 64-bit 66 MHz, 3.3 V, NOT 5 V tolerant.
- On Die Termination (ODT) with 8.3K Ω pull-up to 3.3V for PCI signals.
- Six external REQ/GNT Pairs for internal arbiter on segment A.
- Programmable bus parking on either the last agent or always on the 41110 Bridge
- 2-level programmable round-robin internal arbiter with Multi-Transaction Timer (MTT)
- External PCI clock-feed support for asynchronous primary and secondary domain operation.
- 64-bit addressing for upstream and downstream transactions
- Downstream LOCK# support.
- No upstream LOCK# support.
- PCI fast Back-to-Back capable as target.
- Up to four active and four pending upstream memory read transactions
- Up to two downstream delayed (memory read, I/O read/write and configuration read/write) transaction.
- Tunable inbound read prefetch algorithm for PCI MRM/MRL commands
- Device hiding support for secondary PCI devices.
- Secondary bus Private Memory support via Opaque memory region
- Local initialization via SMBus
- Secondary side initialization via Type 0 configuration cycles.

Introduction

1

1.1 About This Document

This document provides information on the Intel® 41110 Serial to Parallel PCI Bridge, including a functional overview, signal descriptions, mechanical data, package signal location and bus functional waveforms.

1.2 Product Overview

The Intel® 41110 Serial to Parallel PCI Bridge (also called the 41110 Bridge) integrates one PCI Express to PCI/PCI-X bridge. The bridge follows the PCI-to-PCI Bridge programming model. The PCI Express port is compatible with the *PCI Express Specification*, Revision 1.0a. The PCI interface is compatible with the *PCI Local Bus Specification*, Revision 2.3 and *PCI-X Addendum to the PCI Local Bus Specification*, Revision 1.0b.

Signal Description

2

The “#” symbol at the end of a signal name indicates that the active, or asserted state, occurs when the signal is at a low voltage level. When “#” is not present after the signal name, the signal is asserted when at the high voltage level. The following notations are used to describe the signal type:

- I: Input pin
- O: Output pin
- OD: Open-drain Output pin
- I/O: Bidirectional Input/Output pin
- I/OD: Bidirectional Input/Open-drain Output pin

2.1 On Die Termination (ODT)

The 41110 Bridge incorporates on-die termination for most of the PCI interface signals. This eliminates the need for the system designer to incorporate external pull-up resistors in the design.

The following signals have an on die termination of $8.33K \Omega \pm 40\%$:

2.2 PCI Express Interface

Table 2. PCI Express Interface Pins

Signal	I/O	Description
REFCLKp/ REFCLKn	I	PCI Express Reference Clocks: 100 MHz differential clock pair.
PETp[7:0]/ PETn[7:0]	O	PCI Express Serial Data Transmit: PCI Express differential data transmit signals. X8 Mode: All PETp[7:0]/ PETn[7:0] are used X4 Mode: Only PETp[3:0]/ PETn[3:0] are used x1 Mode: Either PETp[0]/ PETn[0] is used or PETp[7]/ PETn[7] is used
PERp[7:0]/ PERn[7:0]	I	PCI Express Serial Data Receive: PCI Express differential data receive signals. X8 Mode: All PERp[7:0]/ PERn[7:0] are used X4 Mode: Only PERp[3:0]/ PERn[3:0] are used x1 Mode: Either PERp[0]/ PERn[0] is used or PERp[7]/ PERn[7] is used
PE_RCOMP[1:0]	I	PCI Express Compensation Inputs: Analog signals. Connect to a 24.9Ω±1% pull-up resistor to 1.5V. A single resistor can be used for both signals.
Total	36	

2.3 PCI Bus Interface

Table 3. PCI Interface Pins (Sheet 1 of 2)

Signal	I/O	Description
A_AD[31:0]	I/O	<p>PCI Address/Data: These signals are a multiplexed address and data bus. During the address phase or phases of a transaction, the initiator drives a physical address on A_AD[31:0]. During the data phases of a transaction, the initiator drives write data, or the target drives read data.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_C/BE#[3:0]	I/O	<p>Bus Command and Byte Enables: These signals are a multiplexed command field and byte enable field. During the address phase or phases of a transaction, the initiator drives the transaction type on C/BE#[3:0]. When there are two address phases, the first address phase carries the dual address command and the second address phase carries the transaction type. For both read and write transactions, the initiator drives byte enables on C/BE#[3:0] during the data phases.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_PAR	I/O	<p>Parity: Even parity calculated on 36 bits - AD[31:0] plus C/BE[3:0]#. It is calculated on all 36 bits regardless of the valid byte enables. It is generated for address and data phases. It is driven identically to the AD[31:0] lines, except it is delayed by exactly one PCI clock. It is an output during the address phase for all 41110 Bridge initiated transactions and all data phases when the 41110 Bridge is the initiator of a PCI write transaction, and when it is the target of a read transaction. 41110 Bridge checks parity when it is the initiator of PCI read transactions and when it is the target of PCI write transactions.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_DEVSEL#	I/O	<p>Device Select: The bridge asserts DEVSEL# to claim a PCI transaction. As a target, the 41110 Bridge asserts DEVSEL# when a PCI master peripheral attempts an access an address destined for PCI Express. As an initiator, DEVSEL# indicates the response to a 41110 Bridge initiated transaction on the PCI bus. DEVSEL# is tri-stated from the leading edge of A_RST#. DEVSEL# remains tri-stated by the 41110 Bridge until driven as a target.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_FRAME#	I/O	<p>Frame: FRAME# is driven by the Initiator to indicate the beginning and duration of an access. While FRAME# is asserted data transfers continue. When FRAME# is negated the transaction is in the final data phase.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_IRDY#	I/O	<p>Initiator Ready: IRDY# indicates the ability of the initiator to complete the current data phase of the transaction. A data phase is completed when both IRDY# and TRDY# are sampled asserted.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_TRDY#	I/O	<p>Target Ready: Indicates the ability of the target to complete the current data phase of the transaction. A data phase is completed when both TRDY# and IRDY# are sampled asserted. TRDY# is tri-stated from the leading edge of RST#. TRDY# remains tri-stated by the 41110 Bridge until driven as a target.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_STOP#	I/O	<p>Stop: Indicates that the target is requesting an initiator to stop the current transaction.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_PERR#	I/O	<p>Parity Error: Driven by an external PCI device when it receives data that has a parity error. Driven by 41110 Bridge when, as an initiator it detects a parity error during a read transaction and as a target during write transactions.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>
A_SERR#	I	<p>System Error: The 41110 Bridge samples SERR# as an input and conditionally forwards it to the PCI Express.</p> <p>No External pull-up resistors are required on the system board for these signals.</p>

Table 3. PCI Interface Pins (Sheet 2 of 2)

Signal	I/O	Description
A_REQ#[5:0]	I	PCI Requests: REQ# receives request inputs into the internal arbiter. No External pull-up resistors are required on the system board for these signals.
A_GNT#[5:0]	O	PCI Grants: GNT# is the bus grant output corresponding to request input bits[5:0] from the internal arbiter. GNT# indicates that an initiator can start a transaction on the PCI bus. No External pull-up resistors are required on the system board for these signals.
A_M66EN	I/OD	66 MHz Enable: This input signal from the PCI Bus indicates the speed of the PCI Bus. If it is high then the Bus speed is 66 MHz and if it is low then the bus speed is 33 MHz. This signal will be used to generate appropriate clock (33 or 66 MHz) on the PCI Bus. Use an approximately 8.2K Ω resistor to pull to VCC33 or pull-down to ground.
A_PCIXCAP	I	PCI-X Capable: Indicates whether all devices on the PCI bus are PCI-X devices, so that the 41110 Bridge can switch into PCI-X mode. Use an approximately 8.2K Ω resistor to pull to VCC33.
A_LOCK#	O	PCI Lock: Indicates an exclusive bus operation and may require multiple transactions to complete. This signal is an output from the bridge when it is initiating exclusive transactions on PCI. LOCK# is ignored when PCI masters are granted the bus. Locked transaction do not propagate upstream. No External pull-up resistors are required on the system board for these signals.
Total	59	

2.4 PCI Bus Interface 64-Bit Extension

Table 4. PCI Interface Pins: 64-Bit Extensions

Signal	I/O	Description
A_AD[63:32]	I/O	PCI Address/Data: These signals are a multiplexed address and data bus. This bus provides an additional 32 bits to the PCI bus. During the data phases of a transaction, the initiator drives the upper 32 bits of 64-bit write data, or the target drives the upper 32 bits of 64-bit read data, when REQ64# and ACK64# are both asserted.
A_C/BE#[7:4]	I/O	Bus Command and Byte enables upper 4 bits: These signals are a multiplexed command field and byte enable field. For both reads and write transactions, the initiator will drive byte enables for the AD[63:32] data bits on C/BE7:4] during the data phases when REQ64# and ACK64# are both asserted.
A_PAR64	I/O	PCI interface upper 32 bits parity: This carries the even parity of the 36 bits of AD[63:32] and C/BE#[7:4] for both address and data phases.
A_REQ64#	I/O	PCI interface request 64-bit transfer: This is asserted by the initiator to indicate that the initiator is requesting a 64-bit data transfer. It has the same timing as FRAME#. When the 41110 Bridge is the initiator, this signal is an output. When the 41110 Bridge is the target this signal is an input.
A_ACK64#	I/O	PCI interface acknowledge 64-bit transfer: This is asserted by the target only when REQ64# is asserted by the initiator, to indicate the target ability to transfer data using 64 bits. It has the same timing as DEVSEL#.
Total	39	

2.5 PCI Bus Interface Clocks and, Reset and Power Management

Table 5. PCI Clock and Reset Pins

Signal	I/O	Description
A_CLKO[6:0]	O	<p>PCI Clock Output: 33/66/100/133 MHz clock for a PCI device. A_CLK[6] must be connected to the respective A_CLKIN input. for feeding the PCI interface logic. Unused clock outputs may be disabled via the “Offset 43: PCLKC – PCI Clock Control” register and should be treated as no connects on the board.</p> <p><i>Note:</i> Registers are listed in the <i>Intel® 41110 Serial to Parallel PCI Bridge Developer’s Manual</i>.</p>
A_CLKIN	I	<p>PCI Clock In: This signal is PCI clock feedback input. This pin should be connected to the corresponding A_CLKO[6] through a $22\Omega \pm 1\%$ series resistor.</p>
A_RST#	O	<p>PCI Reset: The bridge asserts RST# to reset devices that reside on the secondary PCI bus.</p>
A_PME#	I	<p>PCI Power Management Event: PCI bus power management event signal. This is a shared open drain input from all the PCI cards on the corresponding PCI bus segment. This is a level sensitive signal that will be converted to a PME event on PCI Express.</p> <p>This pin does not have on-die 8.3K pull-up. This pull-up must be provided externally.</p>
Total	10	

2.6 Interrupt Interface

This section lists the interrupt interface signals. There is one set of interrupt signals for the standard INTA:INTD PCI signals.

Table 6. Interrupt Interface Pins

Signal	I/O	Description
A_INTA# A_INTB# A_INTC# A_INTD#	I	<p>Interrupt Request Bus: The interrupt lines from PCI interrupts INTA#:INTD# can be routed to these interrupt lines.</p> <p>Refer to the <i>Intel® 41110 Serial to Parallel PCI Bridge Design Guide</i> for more information on device numbering.</p>
Total	4	

2.7 Reset Straps

The following signals are used for static configuration. These signals are all sampled on the rising edge of PERST#.

Table 7. Reset Strap Pins

Signal	I/O	Description
A_133EN	I	PCI-X 133 MHz Enable: This pin, when high, allows the PCI-X segment to run at 133 MHz when A_PCIXCAP is sampled high. When low, the PCI-X segment will only run at 100 MHz when A_PCIXCAP is sampled high. Use an approximately 8.2KΩ resistor to pull to VCC33 or pull-down to ground.
A_STRAP[6:0]	I	Internal Test Modes: Straps 6, 2:0 should be pulled low and straps 5:3 must be pulled high for normal operation. <u>A_STRAP</u> <u>Logic Level</u> 0 '0' 1 '0' 2 '0' 3 '1' 4 '1' 5 '1' 6 '0' Use approximately an 8.2KΩ resistor to pull-up to VCC33 or pull-down to VSS
A_TEST[2:1]	I	Internal Test Modes: These straps should be pulled high to VCC33. Use approximately an 8.2KΩ resistor to pull-up to VCC33.
CFGRETRY	I	Configuration Retry: This pin, when sampled high sets the Configuration Cycle Retry Bit (bit 3) in the Bridge Initialization Register at Offset FC. If no local initialization is needed, this pin should be pulled low to VSS. Refer to the <i>Intel® 41110 Serial to Parallel PCI Bridge Design Guide</i> for more information.
STRAP_V_1	I	Pull up to VCC33
STRAP_V_2	I	Pull up to VCC33
STRAP_V_3	I	Pull up to VCC33
STRAP_V_4	I	Pull up to VCC33
STRAP_V_5	I	Pull up to VCC33
STRAP_V_6	I	Pull up to VCC33
STRAP_V_7	I	Pull up to VCC33
STRAP_V_8	I	Pull up to VCC33
STRAP_V_9	I	Pull up to VCC33
STRAP_V_10	I	Pull up to VCC33
STRAP_V_11	I	Pull up to VCC33
STRAP_V_12	I	Pull up to VCC33
STRAP_V_13	I	Pull up to VCC33
STRAP_V_14	I	Pull up to VCC33
STRAP_V_15	I	Pull down to GND
Total	27	

2.8 SMBus Interface

Table 8. SMBus Interface Pins

Signal	I/O	Description	
SMBCLK	I/OD	SMBus Clock: This signal should be pulled to 3.3V via an 8.2KΩ resistor.	
SMBDAT	I/OD	SMBus Data: This signal should be pulled to 3.3V via an 8.2KΩ resistor.	
SMBUS[5] SMBUS[3:1]	I	SMBus Addressing Straps: These straps set the SMBus Address for 41110 Bridge. The address is determined as indicated below:	
		Bit 7	'1'
		Bit 6	'1'
		Bit 5	SMBUS[5]
		Bit 4	'0'
		Bit 3	SMBUS[3]
		Bit 2	SMBUS[2]
Bit 1	SMBUS[1]		
		These signals (bits 5, 3:1) should be pulled up to 3.3V or down to ground. Sampled at the rising edge of PERST#.	
Total	6		

2.9 Miscellaneous Pins

Table 9. Miscellaneous Pins

Signal	I/O	Description
CFGRST#	O	Configuration Reset: This signal is asserted low when ever the bridge goes through a fundamental reset (PERST#, RSTIN#, or PCI Express Reset). This signal should be used to indicate when the local initialization methods should be executed. Refer to the <i>Intel® 41110 Serial to Parallel PCI Bridge Design Guide</i> for more information.
PERST#	I	PCI Express Fundamental Reset: When low, asynchronously resets the internal logic (including sticky bits).
RSTIN#	I	Reset In: When Asserted, this signal asynchronously resets the internal logic and asserts A_RST# output. This signal should be pulled high for adapter card usage.
TCK	I	TAP Clock In: This is the input clock to the JTAG TAP controller. Acceptable frequency is 0-16MHz If not utilizing JTAG, this signal can be left as a no connect.
TDI	I	Test Data In: This is the serial data input to the JTAG BSCAN shift register chain and to the JTAG BSCAN control logic. This is latched in on the rising edge of TCK. If not utilizing JTAG, this signal can be left as a no connect.
TDO	O	Test Data Output: This is the serial data output from the JTAG BSCAN logic If not utilizing JTAG, this signal can be left as a no connect.

Signal	I/O	Description
TMS	I	Test Mode Select: This signal controls the TAP controller state machine to move to different states and is sampled on the rising edge of TCK. If not utilizing JTAG, this signal can be left as a no connect.
TRST#	I	Test Reset In: This signal is used to asynchronously reset the JTAG BSCAN logic. If not utilizing JTAG, connect this signal to ground through a 1K Ω pull-down resistor.
RESERVED[8:1]	I	Reserved: (8 pins) These input pins should be pulled low Use an approximately 8.2K Ω resistor to pull-down to ground.
NC[19:18], NC[16:1] A_NC[10:1]	O	No Connect: (39 pins) These output pins should be left floating
RESERVED	O	No Connect
RESERVED	O	No Connect
CMODE	I/O	This signal requires an external pull-up, 8.2K Ω to 3.3V
Total	47

3.8 PCI Express Interface DC Specifications

3.8.1 Differential Transmitter (TX) DC Output Specifications

Table 18 defines the DC specifications of parameters for the differential output at all transmitters (TXs). The parameters are specified at the component pins.

Table 18. Differential Transmitter (TX) DC Output Specifications (Sheet 1 of 2)

Symbol	Parameter	Min	Nom	Max	Units	Comments
V _{TX-DIFFp-p}	Differential Peak to Peak Output Voltage	0.80		1.2	V	$V_{TX-DIFFp-p} = 2 * V_{TX-D+} - V_{TX-D-} $ See Note 1.
V _{TX-DE-RATIO}	De-Emphasized Differential Output Voltage (Ratio)	-3.0	-3.5	-4.0	dB	This is the ratio of the V _{TX-DIFFp-p} of the second and following bits after a transition divided by the V _{TX-DIFFp-p} of the first bit after a transition See Note 1.
V _{TX-CM-ACp}	AC Peak Common Mode Output Voltage			20	mV	$V_{TX-CM-ACp} = V_{TX-D+} + V_{TX-D-} / 2 - V_{TX-CM-DC}$ $V_{TX-CM-DC} = DC_{(avg)} \text{ of } V_{TX-D+} + V_{TX-D-} / 2 \text{ during L0}$ See Note 1.
V _{TX-CM-DC-ACTIVE-IDLE-DELTA}	Absolute Delta of DC Common Mode Voltage During L0 and Electrical Idle	0		100	mV	$ V_{TX-CM-DC} [\text{during L0}] - V_{TX-CM-DC} [\text{during electrical idle}] \leq 100\text{mV}$ $V_{TX-CM-DC} = DC_{(avg)} \text{ of } V_{TX-D+} + V_{TX-D-} / 2 [\text{electrical idle}]$ See Note 1.

Table 18. Differential Transmitter (TX) DC Output Specifications (Sheet 2 of 2)

$V_{TX-CM-DC-LINE-DELTA}$	Absolute Delta of DC Common Mode Voltage between D+ and D-.	0		25	mV	$ V_{TX-CM-DC-D+} [during L0] - V_{TX-CM-DC-D-} [During L0.] \leq 25mV$ $V_{TX-CM-DC-D+} = DC_{(avg)} \text{ of } V_{TX-D+} [during L0]$ $V_{TX-CM-DC-D-} = DC_{(avg)} \text{ of } V_{TX-D-} [during L0]$ See Note 1.
$V_{TX-IDLE-DIFFp}$	Electrical Idle Differential Peak Output Voltage	0		20	mV	$V_{TX-IDLE-DIFFp} = V_{TX-IDLE-D+} - V_{TX-IDLE-D-} \leq 20mV$ See Note 1.
$V_{TX-RCV-DETECT}$	The amount of voltage change allowed during Receiver Detection.			600	mV	The total amount of voltage change that a transmitter can apply to sense whether a low impedance receiver is present.
$RL_{TX-DIFF}$	Differential Return Loss	12			dB	Measured over 50 MHz to 1.25 GHz See Note 2.
RL_{TX-CM}	Common Mode Return Loss	6			dB	Measured over 50 MHz to 1.25 GHz See Note 2.
$Z_{TX-DIFF-DC}$	DC Differential TX Impedance	80	100	120	Ohms	TX DC Differential Mode Low impedance
$Z_{TX-COM-High-IMP-DC}$	Transmitter Common Mode High Impedance State (DC)	5 k		20k	Ohms	TX DC High Impedance.
C_{TX}	AC Coupling Capacitor	75		200	nF	All transmitters shall be AC coupled. The AC coupling is required either within the media or within the transmitting component itself.

1. Specified at the measurement point into a timing and voltage compliance test load as shown in [Figure 2, "Compliance Test/Measurement Load"](#) on page 23 and measured over any 250 consecutive TX UIs. (Also refer to the Transmitter Compliance Eye Diagram as shown in Minimum Transmitter Timing and Voltage Output Compliance Specification.)
2. The transmitter input impedance shall result in a differential return loss greater than or equal to 12 dB and a common mode return loss greater than or equal to 6 dB over a frequency range of 50 MHz to 1.25 GHz. This input impedance requirement applies to all valid input levels. The reference impedance for return loss measurements is 50W to ground for both the D+ and D- line (i.e., as measured by a Vector Network Analyzer with 50W probes – see [Figure 2](#)). Note that the series capacitors C_{TX} is optional for the return loss measurement.

3.8.2 Differential Receiver (RX) DC Input Specifications

Table 19 defines the DC specifications of parameters for all differential Receivers (RXs). The parameters are specified at the component pins.

Table 19. Differential Receiver (RX) DC Input Specifications

Symbol	Parameter	Min	Nom	Max	Units	Comments
$V_{RX-DIFFp-p}$	Differential Input Peak to Peak Voltage	0.175		1.200	V	$V_{RX-DIFFp-p} = 2 * V_{RX-D+} - V_{RX-D-} $ See Note 1.
$V_{RX-CM-ACp}$	AC Peak Common Mode Input Voltage			150	mV	$V_{RX-CM-AC} = V_{RX-D+} + V_{RX-D-} /2 - V_{RX-CM-DC}$ $V_{RX-CM-DC} = DC_{(avg)} \text{ of } V_{RX-D+} + V_{RX-D-} /2 \text{ during LO}$ See Note 1.
$RL_{RX-DIFF}$	Differential Return Loss	15			dB	Measured over 50 MHz to 1.25 GHz See Note 2.
RL_{RX-CM}	Common Mode Return Loss	6			dB	Measured over 50 MHz to 1.25 GHz See Note 2
$Z_{RX-DIFF-DC}$	DC Differential Input Impedance	80	100	120	Ohms	RX DC Differential Mode impedance. See Note 3.
$Z_{RX-COM-DC}$	DC Input Common Mode Input Impedance	40	50	60	Ohms	RX DC Common Mode impedance 50 \pm 20% tolerance. See Notes 1 and 3.
$Z_{RX-COM-INITIAL-DC}$	Initial DC Input Common Mode Input Impedance	5	50	60	Ohms	RX DC Common Mode impedance allowed when the receiver terminations are first powered on. See Note 4.
$Z_{RX-COM-HIGH-IMP-DC}$	Powered Down DC Input Common Mode Input Impedance	200 k			Ohms	RX DC Common Mode impedance when the receiver terminations are not powered (i.e., no power). See Note 5.
$V_{RX-IDLE-DET-DIFFp-p}$	Electrical Idle Detect Threshold	65		175	mV	$V_{RX-IDLE-DET-DIFFp-p} = 2 * V_{RX-D+} - V_{RX-D-} $ Measured at the package pins of the Receiver.

- Specified at the measurement point and measured over any 250 consecutive UIs. The test load in [Figure 2, "Compliance Test/Measurement Load"](#) on page 23 should be used as the RX device when taking measurements (also refer to the Receiver Compliance Eye Diagram as shown in [Figure 3, "Minimum Receiver Eye Timing and Voltage Compliance Specification"](#) on page 23). If the clocks to the RX and TX are not derived from the same clock chip the TX UI must be used as a reference for the eye diagram.
- The receiver input impedance shall result in a differential return loss greater than or equal to 15 dB and a common mode return loss greater than or equal to 6 dB over a frequency range of 50 MHz to 1.25 GHz. This input impedance requirement applies to all valid input levels. The reference impedance for return loss measurements for is 50 Ω to ground for both the D+ and D- line (i.e., as measured by a Vector Network Analyzer with 50 Ω probes - see [Figure 2](#)). Note: that the series capacitors C_{TX} is optional for the return loss measurement.
- Impedance during all operating conditions.
- The Rx DC Common Mode Impedance that must be present when the receiver terminations are first enabled to ensure that the Receiver Detect occurs properly. Compensation of this impedance can start immediately and the ($Z_{RX-COM-DC}$) RxDC Common Mode Impedance must be within the specified range by the time Detect is entered.

5. The Rx DC Common Mode Impedance that exists when the receiver terminations are disabled or when no power is present. This helps ensure that the Receiver Detect circuit will not falsely assume a receiver is powered on when it is not.

Figure 1. Minimum Transmitter Timing and Voltage Output Compliance Specification

There are two eye diagrams that must be met for the transmitter. Both eye diagrams must be aligned in time using the jitter median to locate the center of the eye diagram. The different eye diagrams will differ in voltage depending whether it is a transition bit or a de-emphasized bit.

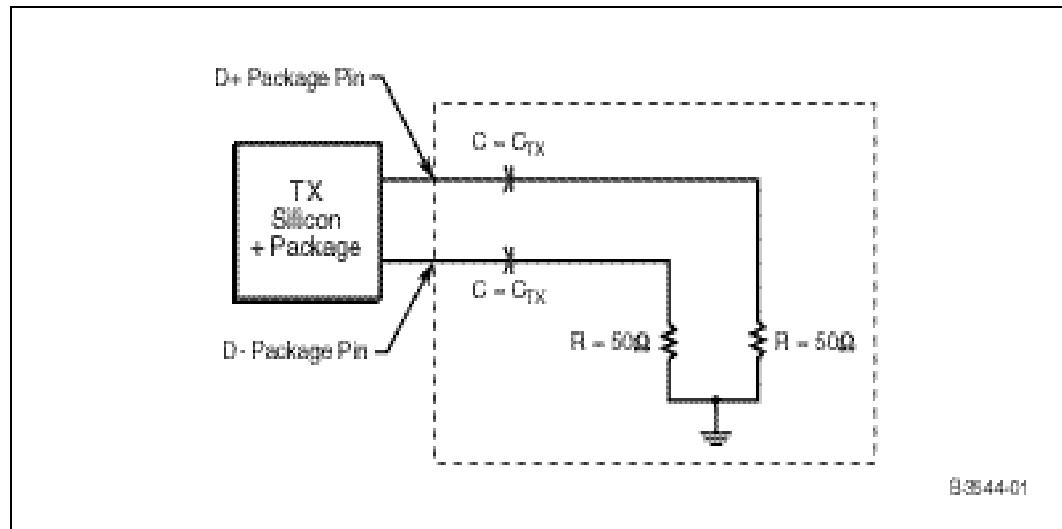

The eye diagram must be valid for any 250 consecutive UIs. An appropriate average TX UI must be used as the interval for measuring the eye diagram.

3.8.3 Compliance Test and Measurement Load

The AC timing and voltage parameters must be verified at the measurement point, as specified by the device vendor within 0.2 inches of the package pins, into a test/measurement load shown in Figure 2.

Note: The allowance of the measurement point to be within 0.2 inches of the package pins is meant to acknowledge that package/board routing may benefit from D+ and D- not being exactly matched in length at the package pin boundary. If the vendor does not explicitly state where the measurement point is located, the measurement point is assumed to be the D+ and D-package pins.

Figure 2. Compliance Test/Measurement Load

The test load is shown at the transmitter package reference plane, but the same Test/Measurement load is applicable to the receiver package reference plane. CTX is an optional portion of the measurement test load. The measurement should be taken on the opposite side of the capacitor from the package, and the value of the CTX must be in the range of 75 nF to 200 nF.

Figure 3. Minimum Receiver Eye Timing and Voltage Compliance Specification

The RX eye diagram must be aligned in time using the jitter median to locate the center of the eye diagram. The eye diagram must be valid for any 250 consecutive UIs. An appropriate average TX UI must be used as the interval for measuring the eye diagram.

3.8.4 PCI and PCI-X Interface DC Specifications

Table 20 summarizes the DC specifications for 3.3V signaling.

Table 20. DC Specifications for PCI and PCI-X 3.3 V Signaling

Symbol	Parameter	Min	Max	Units	Condition	Notes
VCC33	Supply Voltage	3.0	3.6	V		
V _{ih}	Input High Voltage	0.5 VCC33	VCC33 + 0.5	V		
V _{il}	Input Low Voltage	-0.5	0.3VCC33	V		
V _{ipu}	Input Pull-up Voltage	0.7VCC33		V		
I _{il}	Input Leakage Current		±10	μA	0 < V _{in} < VCC33	1
V _{oh}	Output High Voltage	0.9VCC33		V	I _{out} = -500 μA	
V _{ol}	Output Low Voltage		0.1VCC33	V	I _{out} = 1500 μA	
C _{in}	Input Pin Capacitance		10	pF		2
C _{clk}	A_CLKIN Pin Capacitance	5	8	pF		
C _{IDSEL}	IDSEL Pin Capacitance		8	pF		3
L _{pin}	Pin Inductance		20	nH		4
I _{Off}	A_PME# input leakage	-	1	μA	V _o ≤ 3.6 VCC33 off or floating	5

1. Input leakage currents include hi-Z output leakage for all bi-directional buffers with tri-state outputs.
2. Absolute maximum pin capacitance for a PCI/PCIX input except A_CLKIN and A_IDSEL.
3. For conventional PCI only, lower capacitance on this input-only pin allows for non-resistive coupling to A_AD[xx]. PCI-X configuration transactions drive the AD bus four clocks before A_FRAME# asserts (see Section 2.7.2.1, "Configuration Transaction Timing," in the *PCI-X Protocol Addendum to the PCI Local Bus Specification Revision 2.0a*).
4. For conventional PCI, this is a recommendation, not an absolute requirement. For PCI-X, this is a requirement.
5. This input leakage is the maximum allowable leakage into the A_PME# open drain driver when power is removed from VCC33 of the component. This assumes that no event has occurred to cause the device to attempt to assert A_PME#.

3.8.4.1 Input Clock DC Specifications

Table 21. DC Specification for Input Clock Signals

Symbol	Parameter	Min	Max	Units
CLK100	Input Low Voltage	-0.5	0.8	V
CLK100	Input High Voltage	2.0	VCC3.3 + 0.5	V
CLK133	Input Low Voltage	-0.5	0.8	V
CLK133	Input High Voltage	2.0	VCC3.3 + 0.5	V

3.8.4.2 Output Clock DC Specifications

Table 22. DC Specification for Output Clock Signals

Symbol	Parameter	Min	Max	Units	Condition
CLK33	Output Low Voltage		0.4	V	I _{ol} = 1 mA
CLK33	Output High Voltage	2.4		V	I _{oh} = -1 mA
CLK66	Output Low Voltage		0.4	V	I _{ol} = 1 mA
CLK66	Output High Voltage	2.4		V	I _{oh} = -1 mA
CLK100	Output Low Voltage		0.4	V	I _{ol} = 1 mA
CLK100	Output High Voltage	2.4		V	I _{oh} = -1 mA
CLK133	Output Low Voltage		0.4	V	I _{ol} = 1 mA
CLK133	Output High Voltage	2.4		V	I _{oh} = -1 mA

3.9 AC Specifications

3.9.1 PCI and PCI-X AC Characteristics

Table 23. Conventional PCI 3.3V AC Characteristics

Sym	Parameter	Condition	Min	Max	Unit	Note
I _{oh(AC)}	Switching Current High	V _{out} = 0.7VCC33		-32VCC33	mA	
		V _{out} = 0.3VCC33	-12VCC33		mA	1
I _{ol(AC)}	Switching Current Low	V _{out} = 0.18VCC33		38VCC33	mA	
		V _{out} = 0.6VCC33	16VCC33		mA	1
I _{ch}	High Clamp Current	VCC33 + 4 > V _{in} VCC33 + 1	25 + (V _{in} - VCC33 - 1) / 0.015		mA	
I _{cl}	Low Clamp Current	-3 < V _{in} -1	-25 + (V _{in} + 1) / 0.015		mA	
slew _r	Output Rise Slew Rate	0.3VCC33 to 0.6VCC33	1	4	V/ns	2
slew _f	Output Fall Slew Rate	0.6VCC33 to 0.3VCC33	1	4	V/ns	2

1. In conventional PCI switching, current characteristics for A_REQ# and A_GNT# are permitted to be one half of that specified here; i.e., half size drivers may be used on these signals. This specification does not apply to CLK and RSTIN# which are system outputs. "Switching Current High" specifications are not relevant to A_SERR# which is an open drain output.
2. This parameter is to be interpreted as the cumulative edge rate across the specified range rather than the instantaneous rate at any point within the transition range. For more details on slew rate measurement conditions please refer to the *PCI-X Electrical and Mechanical Addendum to the PCI Local Bus Specification, Revision 2.0a*

Table 24. PCI-X 3.3V AC Characteristics

Sym	Parameter	Condition	Min	Max	Unit	Note
$I_{oh(AC)}$	Switching Current High	$0 < V_{CC33} - V_{out} \leq 3.6V$		$-74(V_{CC33} - V_{out})$	mA	
		$0 < V_{CC33} - V_{out} \leq 1.2V$	$-32(V_{CC33} - V_{out})$		mA	1
		$1.2V < V_{CC33} - V_{out} \leq 1.9V$	$-11(V_{CC33} - V_{out}) - 25.2$		mA	1
		$1.9V < V_{CC33} - V_{out} \leq 3.6V$	$-1.8(V_{CC33} - V_{out}) - 42.7$		mA	1
$I_{ol(AC)}$	Switching Current Low	$0 \leq V_{out} \leq 3.6V$		$100V_{out}$	mA	
		$0 \leq V_{out} \leq 1.3V$	$48V_{out}$			1
		$1.3V < V_{out} \leq 3.6V$	$5.7V_{out} + 55$			1
I_{cl}	Low Clamp Current	$-3V < V_{in} \leq -0.8875V$	$-40 + (V_{in} + 1) / 0.005$		mA	
		$-0.8875V < V_{in} \leq -0.625V$	$-25 + (V_{in} + 1) / 0.015$		mA	
I_{ch}	High Clamp Current	$0.8875V < V_{in} - V_{CC33} \leq -4V$	$40 + (V_{in} - V_{CC33} - 1) / 0.005$		mA	
		$0.625V < V_{in} - V_{CC33} \leq 0.8875V$	$25 + (V_{in} - V_{CC33} - 1) / 0.015$		mA	
$slew_r$	Output Rise Slew Rate	$0.3V_{CC33}$ to $0.6V_{CC33}$	1	4	V/ns	2
$slew_f$	Output Fall Slew Rate	$0.6V_{CC33}$ to $0.3V_{CC33}$	1	4	V/ns	2

1. In conventional PCI switching, current characteristics for A_REQ# and A_GNT# are permitted to be one half of that specified here; i.e., half size drivers may be used on these signals. This specification does not apply to CLK and RST# which are system outputs. "Switching Current High" specifications are not relevant to A_SERR#, which is an open drain output.
2. This parameter is to be interpreted as the cumulative edge rate across the specified range rather than the instantaneous rate at any point within the transition range. For more details on slew rate measurement conditions please refer to the *PCI-X Electrical and Mechanical Addendum to the PCI Local Bus Specification, Revision 2.0a*.

3.10 Voltage Filter Specifications

The 41110 Bridge requires voltage filtering to reduce noise on critical voltage planes. There are two filter types necessary on the platform:

- Analog Voltage Filter (PCI-Express and PCI)
- Bandgap Filter

Note: For filter specifications, refer to the *Intel® 41110 Serial to Parallel PCI Bridge Design Guide*.

3.11 VCC15 and VCC33 Voltage Requirements

The 41110 Bridge requires that the VCC33 voltage rail be equal to or no less than 0.5V below VCC15 (absolute voltage value) at all times during 41110 Bridge operation, including during system power up and power down. In other words, the following must always be true:

$$V_{CC33} \geq (V_{CC15} - 0.5V)$$

Figure 4 graphically illustrates this requirement. This can be accomplished by placing a diode (with a voltage drop $< 0.5V$) between VCC15 and VCC33. Anode will be connected to VCC15 and cathode will be connected to VCC33.

Figure 4. Voltage Requirements VCC33 versus VCC15

3.12 Timing Specifications

3.12.1 PCI Express Interface Timing

3.12.1.1 Differential Transmitter (TX) AC Output Specifications

Table 25 defines the AC specifications of parameters for the differential output at all transmitters (TXs). The parameters are specified at the component pins.

Table 25. Differential Transmitter (TX) AC Output Specifications

Symbol	Parameter	Min	Nom	Max	Units	Comments
UI	Unit Interval	399.88	400	400.12	ps	Each UI is 400 ps +/- 300 ppm. UI does not account for SSC dictated variations. See Note 1.
T_{TX-EYE}	Minimum TX Eye Width	0.70			UI	The maximum transmitter jitter can be derived as $T_{TX-MAX-JITTER} = 1 - T_{TX-EYE} = .3 \text{ UI}$. See Notes 2 and 3.
$T_{TX-EYE-MEDIAN-to-MAX-JITTER}$	Maximum time between the jitter median and maximum deviation for the median			0.15	UI	Jitter is defined as the measurement variation of the crossing points ($V_{TX-DIFFP-P} = 0V$) in relation to an appropriate average TX UI. See Notes 2 and 3.
$T_{TX-RISE}$, $T_{TX-FALL}$	D+/D- TX Output Rise/Fall Time	0.125			UI	See Notes 2 and 4.
$T_{TX-IDLE-MIN}$	Minimum time spent in Electrical Idle	50			UI	Minimum time a transmitter must be in electrical idle.
$T_{TX-IDLE-SET-TO-IDLE}$	Maximum time to transition to a valid Electrical Idle after sending an Electrical Idle ordered-set			20	UI	After sending an electrical idle ordered-set, the transmitter must meet all electrical idle specifications within this time.
$T_{TX-IDLE-RCV-DETECT-MAX}$	Maximum time spent in Electrical Idle before initiating a receiver detect sequence.			100	ms	Maximum time spent in Electrical Idle before initiating a receiver detect sequence.
$L_{TX-SKEW}$	Lane-to-Lane Output Skew			500	ps	Between any two Lanes within a single Transmitter.

1. No test load is necessarily associated with this value.
2. Specified at the measurement point into a timing and voltage compliance test load as shown in [Figure 2](#), "Compliance Test/Measurement Load" on page 23 and measured over any 250 consecutive TX UIs. (Also

refer to the Transmitter Compliance Eye Diagram as shown in Minimum Transmitter Timing and Voltage Output Compliance Specification.)

3. A $T_{TX-EYE} = 0.70$ UI provides for a total sum of deterministic and random jitter budget of $T_{TX-JITTER-MAX} = 0.30$ UI for the transmitter collected over any 250 consecutive TX UIs. The $T_{TX-EYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total TX jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value.
4. Measured between 20-80% at Transmitter package pins into a test load as shown in [Figure 2](#) for both V_{TX-D+} and V_{TX-D-} .

3.12.1.2 Differential Receiver (RX) AC Input Specifications

[Table 26](#) defines the AC specifications of parameters for all differential Receivers (RXs). The parameters are specified at the component pins.

Table 26. Differential Receiver (RX) AC Input Specifications

Symbol	Parameter	Min	Nom	Max	Units	Comments
UI	Unit Interval	399.88	400	400.12	ps	The UI is 400 ps +/-300 ppm. UI does not account for SSC dictated variations. See Note 1.
T_{RX-EYE}	Minimum Receiver Eye Width	0.4			UI	The maximum interconnect media and transmitter jitter that can be tolerated by the receiver can be derived as $T_{RX-MAX-JITTER} = 1 - T_{RX-EYE} = 0.6$ UI See Notes 2 and 3.
$T_{RX-EYE-MEDIAN-to-MAX-JITTER}$	Maximum time between the jitter median and maximum deviation from the median.			0.3	UI	Jitter is defined as the measurement variation of the crossing points ($V_{RX-DIFFP-p} = 0$ V) in relation to an appropriate average TX UI. See Notes 2 and 3.
$T_{RX-IDLE-DET-DIFF-ENTERTIME}$	Unexpected Electrical Idle Enter Detect Threshold Integration Time			10	ms	An unexpected electrical idle ($V_{RX-DIFFP-p} < V_{RX-IDLE-DET-DIFFP-p}$) must be recognized no longer than $T_{RX-IDLE-DET-DIFF-ENTERTIME}$ to signal an unexpected idle condition.
$L_{RX-SKEW}$	Total Skew			20	ns	Across all Lanes on a port. This includes variation in the length of a skip ordered-set (e.g., COM and 1 to 5 SKP symbols) at the RX as well as any delay differences arising from the interconnect itself.

1. No test load is necessarily associated with this value.
2. Specified at the measurement point and measured over any 250 consecutive UIs. The test load in [Figure 2](#), “Compliance Test/Measurement Load” on page 23 should be used as the RX device when taking measurements (also refer to the Receiver Compliance Eye Diagram as shown in [Figure 3](#), “Minimum Receiver Eye Timing and Voltage Compliance Specification” on page 23). If the clocks to the RX and TX are not derived from the same clock chip the TX UI must be used as a reference for the eye diagram.
3. A $T_{RX-EYE} = 0.40$ UI provides for a total sum of 0.60 UI deterministic and random jitter budget for the transmitter and interconnect collected any 250 consecutive UIs. The $T_{RX-EYE-MEDIAN-to-MAX-JITTER}$ specification ensures a jitter distribution in which the median and the maximum deviation from the median is less than half of the total .6 UI jitter budget collected over any 250 consecutive TX UIs. It should be noted that the median is not the same as the mean. The jitter median describes the point in time where the number of jitter points on either side is approximately equal as opposed to the averaged time value. If the clocks to the RX and TX are not derived from the same clock chip, the appropriate average TX UI must be used as the reference for the eye diagram.

3.12.2 PCI and PCI-X Interface Timing

Table 27. PCI Interface Timing

Functional Operating Range ($V_{CC33} = 3.3 \text{ V} \pm 5\%$, $T_{case} = 0^\circ\text{C}$ to 105°C)

Symbol	Parameter	66 MHz		33 MHz		Units	Notes
		Min	Max	Min	Max		
T_{val}	CLK to Signal Valid Delay; bused signals	2	6	2	11	ns	1, 2, 3
$T_{val}(ptp)$	CLK to Signal Valid Delay; point-to-point signals	2	6	2	12	ns	1, 2, 3
T_{on}	Float to Active Delay	2		2		ns	1, 7
T_{off}	Active to Float Delay		14		28	ns	1, 7
T_{su}	Input Setup Time to CLK; Bused signals	3		7		ns	3, 4, 8
$T_{su}(ptp)$	Input Setup Time to CLK; point-to-point	5		10,12		ns	3, 4
T_h	Input Hold Time from CLK	0		0		ns	4
T_{rst}	Reset Active Time after power stable	1		1		ms	5
$T_{rst-clk}$	Reset Active Time after CLK stable	100		100		μs	5
$T_{rst-off}$	Reset Active to output float delay		40		40	ns	5, 6
T_{rrsu}	PaREQ64# to RSTIN# setup time	10		10		clocks	
T_{rrh}	RSTIN# to PaREQ64# hold Time	0	50	0	50	ns	9
T_{rhfa}	RSTIN# high to first configuration access	2^{25}		2^{25}		clocks	
T_{rhff}	RSTIN# high to first PaFRAME# Assertion	5		5		clocks	
T_{pvrh}	Power Valid to RSTIN# High	100		100		ms	

1. It is important that all driven signal transitions drive to their V_{oh} or V_{ol} level within one T_{cyc} .
2. Minimum times are measured at the package pin (not the test point) with the load circuit shown in the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*. Maximum times are measured with the test point and load circuit shown in the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*.
3. A_REQ_[5:0]# and A_GNT_[5:0]# are point-to-point signals and have different input setup times than do bused signals. A_GNT_[5:0]# and A_REQ_[5:0]# have a setup of 5 ns at 66 MHz. All other signals are bused.
4. See [Section 3.12, "Timing Specifications" on page 28](#) and the measurement conditions in the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*.
5. If A_M66EN is asserted, CLK is stable when it meets the requirements in the *PCI Local Bus Specification Revision 2.3*. RSTIN# is asserted and deasserted asynchronously with respect to CLK.
6. When A_M66EN is asserted, the minimum specification for $T_{val}(\text{min})$, $T_{val}(\text{ptp})(\text{min})$, and T_{on} may be reduced to 1 ns if a mechanism is provided to guarantee a minimum value of 2 ns when A_M66EN is deasserted.
7. For purposes of active/float timing measurements, the Hi-Z or "off" state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
8. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time. Refer to the *PCI Local Bus Specification Revision 2.3* for more details.
9. Maximum value is also limited by delay to the first transaction (T_{rhff}).

T_{prh}	RSTIN# to PCI-X initialization pattern hold time	0	50	0	50	ns, 7
T_{rlcx}	Delay from RSTIN# low to CLK frequency change	0		0		ns

1. See the timing measurement conditions in [Section 3.12, "Timing Specifications" on page 28](#).
2. Minimum times are measured at the package pin (not the test point) with the load circuit shown in the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*. Maximum times are measured with the test point and load circuit shown in *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*.
3. See the timing measurement conditions in [Section 3.12, "Timing Specifications" on page 28](#) and the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*.
4. RST# is asserted and deasserted asynchronously with respect to CLK.
5. For purposes of Active/Float timing measurements, the Hi-Z or "off" state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
6. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
7. Maximum value is also limited by delay to the first transaction (T_{rhfa}). The PCI-X initialization pattern control signals after the rising edge of RSTIN# must be deasserted no later than two clocks before the first PaFRAME# and must be floated no later than one clock before PaFRAME# is asserted.
8. Device must meet this specification independent of how many outputs switch simultaneously.

3.12.3 PCI and PCI-X Clock Specification

Clock measurement conditions are the same for PCI-X devices as for conventional PCI devices in a 3.3V signaling environment except for voltage levels specified in [Table 29, “PCI and PCI-X Clock Timings”](#) on page 34. The same spread-spectrum clocking techniques are allowed in PCI-X as for 66 MHz conventional PCI. If a device includes a PLL, that PLL must track the input variations of spread-spectrum clocking specified in [Table 29](#).

Figure 7. PCI-X 3.3V Clock Waveform

Table 29. PCI and PCI-X Clock Timings

Symbol	Parameter		PCI-X 133		PCI-X 66		PCI 66		PCI 33		Units	Notes
			Min	Max	Min	Max	Min	Max	Min	Max		
T_{cyc}	CLK Cycle Time	Average	7.5	20	15	20	15	30	30	∞	ns	1,3,4
		Absolute Minimum	7.375		14.8		14.8		29.7		ns	1,3
T_{high}	CLK high time		3		6		6		11		ns	
T_{low}	CLK low time		3		6		6		11		ns	
T_{jit}	CLK Period Jitter		125	-125	200	-200	200	-200	300	-300	ps	5
Slew Rate												
—	CLK slew rate		1.5	4	1.5	4	1.5	4	1	4	V/ns	2
Spread Spectrum Requirements												
fmod	Modulation frequency		30	33	30	33	30	33			kHz	
fspectrum	Frequency spread		-1	0	-1	0	-1	0			%	

1. For clock frequencies above 33 MHz, the clock frequency may not change beyond the spread-spectrum and jitter limits except while RSTIN# is asserted.
2. This slew rate must be met across the minimum peak-to-peak portion of the clock waveform as shown in the *PCI-X Electrical and Mechanical Addendum, Revision 2.0a*.
3. The minimum clock period must not be violated for any single clock cycle (i.e. accounting for all system jitter).
4. Average T_{cyc} is measured over any 1 μ s period of time and must include all sources of clock variation.
5. Period jitter is the deviation between any single period of the clock, T_{cyc} , and the average period of the clock, $T_{cyc(average)}$.

3.12.4 41110 Bridge Clock Timings

Table 30. 41110 Bridge Clock Timings

Symbol	Parameter	Min	Max	Units	Notes
CLK100					
T_{period}	Average Period	10.0	10.2	ns	6
T_{rise}	Rise time across 600 mV	300	600	ps	7,8
T_{fall}	Fall time across 600 mV	300	600	ps	7,8
—	Rise/Fall Matching		20%		7,9
—	Cross point at 1 V	0.51	0.76	V	
T_{ccjitter}	Cycle to Cycle jitter		200	ps	
—	Duty Cycle	45	55	%	
—	Maximum voltage allowed at input		1.45	V	
—	Minimum voltage allowed at input		-200	mV	
—	Rising edge ringback	0.85		V	
—	Falling edge ring back		0.35	V	
CLK133					
T_{period}	Average Period	7.5	7.65	ns	6
T_{rise}	Rise time across 600 mV	300	600	ps	7,8
T_{fall}	Fall time across 600 mV	300	600	ps	7,8
—	Rise/Fall Matching		20%		7,9
—	Cross point at 1V	0.51	0.76	V	
T_{ccjitter}	Cycle to Cycle jitter		125	ps	10
—	Duty Cycle	45	55	%	
—	Maximum voltage allowed at input		1.45	V	
—	Minimum voltage allowed at input		-200	mV	
—	Rising edge ringback	0.85		V	
—	Falling edge ring back		0.35	V	
CLK33					
T_{period}	CLK period	30.0	N/A	ns	1,2
T_{high}	CLK high time	12.0	N/A	ns	3
T_{low}	CLK low time	12.0	N/A	ns	4
—	Rising edge rate	1.0	4.0	V/ns	5
—	Falling edge rate	1.0	4.0	V/ns	5
T_{rise}	CLK rise time	0.5	2.0	ns	5
T_{fall}	CLK fall time	0.5	2.0	ns	5

1. Period, jitter, offset and skew measured on rising edge @ 1.5V for 3.3V clocks.

2. The average period over any 1 us period of time must be greater than the minimum specified period.
3. T_{high} is measured at 2.4V for non-host outputs.
4. T_{low} is measured at 0.4V for all outputs.
5. For 3.3V clocks T_{rise} and T_{fall} are measured as a transition through the threshold region $V_{ol} = 0.4V$ and $V_{oh} = 2.4V$ (1 mA) JEDEC Specification.
6. Measured at crossing point.
7. Measured from $V_{ol} = 0.2V$ to $V_{oh} = 0.8V$.
8. Still simulating to determine [0.2–0.8 V] or [0.3–0.9 V].
9. Determined as a fraction of $2 \cdot (T_{rise} - T_{fall}) / (T_{rise} + T_{fall})$.
10. Period jitter is the deviation between any single period of the clock, T_{cyc} , and the average period of the clock, $T_{cyc(average)}$.

3.12.4.1 Spread Spectrum Clocking

Spread spectrum clocking can be used on the 41110 Bridge to reduce energy. Spread Spectrum clocking is a common technique used by system designers to meet FCC emissions, where the frequency is deliberately shifted around to spread the energy off of the peak. The following is to be observed when using Spread Spectrum clocking:

- All device timings (including jitter, skew, min/max clock period, output rise/fall time) MUST meet the existing non-spread spectrum specifications
- All non-spread Host and PCI functionality must be maintained in the spread spectrum mode (includes all power management functions.)
- The minimum clock period cannot be violated. The preferred method is to adjust the spread technique to not allow for modulation above the nominal frequency. This technique is often called “down-spreading”. The modulation profile in a modulation period can be expressed as:

Equations:

$$f = \begin{cases} (1 - \delta)f_{nom} + 2f_m \cdot \delta \cdot f_{nom} \cdot t & \text{when } 0 < t < \frac{1}{2f_m}; \\ (1 + \delta)f_{nom} - 2f_m \cdot \delta \cdot f_{nom} \cdot t & \text{when } \frac{1}{2f_m} < t < \frac{1}{f_m}, \end{cases}$$

where:

f_{nom} is the nominal frequency in the non-SSC mode

f_m is the modulation frequency

δ is the modulation amount

t is time.

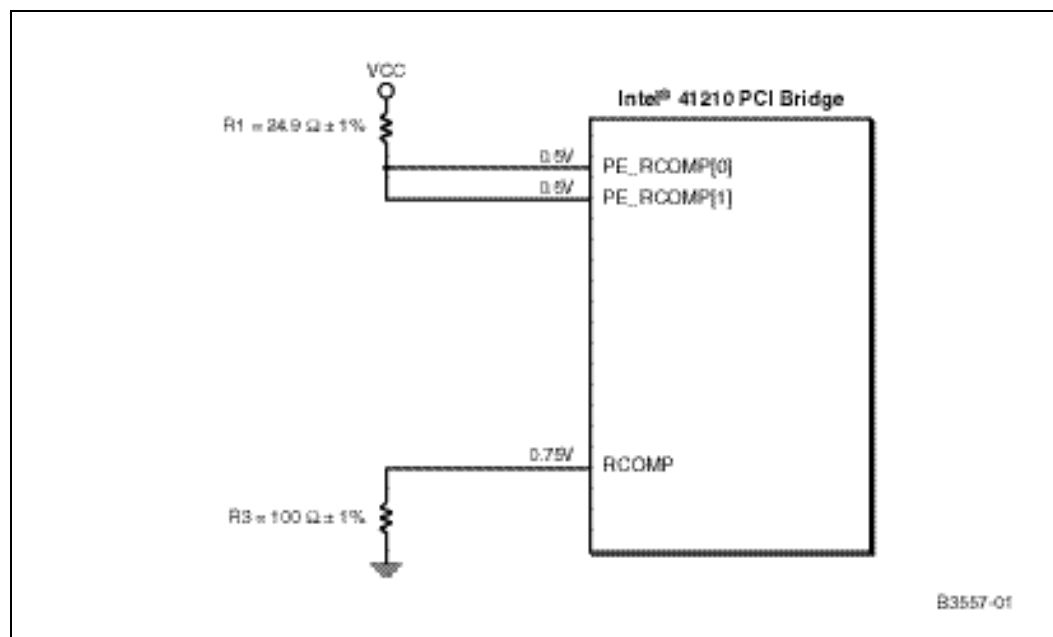

3.13 Reference and Compensation Pins

The 41110 Bridge has one reference pin and two compensation pins:

- **PE_RCOMP[1:0]** are two separate pins that provide voltage compensation for the PCI Express interface on the 41110 Bridge. The nominal compensation voltage is 0.5V. An external $24.9 \pm 1\%$ pull-up resistor should be used to connect to VCC15. A single pull-up resistor can be used to for both of these signals.
- **RCOMP** is an analog PCI interface compensation pin to the 41110 Bridge. A $100 \pm 1\%$ pull-down resistor should be used to connect the **RCOMP** pin to ground.

All three of these implementations are shown in [Figure 8](#).

Figure 8. 41110 Bridge Reference and Compensation Circuit Implementations

3.14 Thermal Specifications

Refer to the *6700PXH 64-bit PCI Hub Thermal/Mechanical Design Guide for Intel 6700PXH 64-bit PCI Hub (PXH)*.

3.14.1 Power

For TDP specifications, refer to [Table 31](#). FC-BGA packages have poor heat transfer capability into the board and have minimal thermal capability without thermal solutions. Intel recommends that system designers plan for a heatsink when using the 41110 Bridge component.

3.14.2 Die Temperature

To ensure proper operation and reliability of the 41110 Bridge component, the die temperatures must be at or below the values specified in [Table 31](#). System and/or component level thermal solutions are required to maintain die temperatures below the maximum temperature specifications.

Table 31. 41110 Bridge Thermal Specifications

Parameter	Maximum
T _{case}	95°C Max

Note: Mode 1: PCI-X 66MHz, 64-bit, 4 slots/devices

3.14.3 Thermal Solution Component Suppliers

Table 32. Torsional Clip Heatsink Thermal Solution

Part	Intel Part Number	Supplier (Part Number)	Contact Information

Note: The enabled components may not be currently available from all suppliers. Contact the supplier directly to verify time of component availability.

Package Specification and Ballout 4

4.1 Package Specification

The 41110 Bridge is in a 567-ball FCBGA package, 31mm X 31mm in size, with a 1.27mm ball pitch (see Figure 9 and Figure 10).

Figure 9. 41110 Bridge Package Dimensions (Top View)

Figure 10. 41110 Bridge Package Dimensions (Side View)

Note: Primary datum -C- and seating plan are defined by the spherical crowns of the solder balls.

Note: All dimensions and tolerances conform to ANSI Y14.5M-1982
